

Serial No. 10/007,177
5962-01-CA

Please replace all prior claims in the application with the following:

Claims 1-16 (canceled)

Claim 17 (currently amended): A method of making a pharmaceutical dosage form comprising:

coextruding an indefinite length of an at least partially melted central core and outer layer to form a co-extrudate having a longitudinal axis, said central core including a pharmaceutical agent disposed in a controlled-release composition, and said outer layer being substantially impervious to water or bodily fluids thereby limiting diffusion of fluids into said central core;

slicing said co-extrudate across the longitudinal axis thereof to form discrete pellets; and

cooling said co-extrudate to solidify the at least partially melted central core and outer layer.

Claim 18 (previously presented): The method of Claim 17, further comprising permitting said co-extrudate to harden before slicing said co-extrudate.

Claim 19 (previously presented): The method of Claim 17, further comprising slicing said co-extrudate perpendicular to said longitudinal axis.

Claim 20 (currently amended): The method of Claim 17, further comprising heating said co-extrudate to a temperature in the range of 30°C to 250°C during coextrusion.

Claim 21 (currently amended): The method of Claim 20, further comprising heating co-extrudate to a temperature in the range of 40°C to 200°C during coextrusion.

Claim 22 (canceled)
